

ABSTRACT

The present disclosure relates to a system and method for providing access to a resource. The system and method both involve providing a graphical user interface (GUI) to an operator with which client connectivity with the resource is enabled, the GUI being
5 configured such that the process used by the operator to facilitate connectivity using the GUI is the same regardless of which underlying connectivity method is used, receiving commands of the operator with the GUI that convey the identity of the client and the resource to be accessed by the client, determining the client network configuration, and establishing client connectivity to the resource.
